

Water Quality Monitoring

CQG Consulting (CQG) has in-house skills to provide integrated surface water and groundwater quality assessment to its clients. This includes assessment of water quality impacts in catchment, lake, river, wetland, estuary and ocean environments including groundwater.

CQG provides practical solutions for surface and groundwater assessment and monitoring.

CQG provides the following water quality monitoring services:

- Surface water quality sampling, monitoring and reporting;
- Stormwater and groundwater quality sampling, monitoring and reporting to assess discharge requirements and compliance with licence approvals;
- Waste water quality assessment (sampling and monitoring) for offsite discharge from industrial sites;
- Baseline water quality assessment to establish environmental values for fresh, estuarine and marine ecosystems; and
- Continual monitoring and assessment for ecosystem health and water quality trends.

CQG has modern equipment and is capable of rapid mobilisation for one-off sampling events through to long term monitoring programs. All equipment is maintained and routinely calibrated to comply with our quality systems.

CQG is a sponsoring partner of the Fitzroy Partnerships for River Health Program formed to provide an integrated approach to water quality management in the Fitzroy Basin.
